AI CONNECT AFRICA

Deliverables Report

Monday 12 October 2026 · Offline AI learning system

Summary of the work completed and merged today, with the evidence for each item, what is still open, and what comes next.

Deliverables

1 · Architecture review and gap list

DONE

What

Decoded and reviewed the 515-message ChatGPT architecture discussion. The earlier online design (Sunbird, web search) is replaced by the offline app; the school design at the end is mostly built already.

Result

A ranked list of what is still missing: tutor-use tracking, teacher-to-learner support, teacher device recovery, hotspot setup helper, and security hardening.

2 · “Tutor used” marks on quiz answers

DONE

What

An answer given after the learner got help from the AI tutor (chat or Practice feedback) is marked “Tutor used”. Older results show as unknown, never as “on their own”.

Result

Shown on the quiz card and in Achievements; counts reach Teacher → Class progress at the next sync. Database schema 31.

3 · Timed homework and holiday assessments

DONE

What

Teachers set the type (Assignment, Homework, Holiday assessment), opening and closing times, an optional time limit, and can attach a PDF.

For learners

Questions stay hidden until Start; one attempt; work is saved while typing and handed in automatically when time runs out, even if the app is closed (also at the next sync).

Result

Teachers see start and hand-in times and late answers. Assessment PDFs never appear in notes or the tutor's search. Schema 32.

4 · Cloud plug-in point for the Rwanda server

DONE

What

Assignments, answers and grades are queued on the device (cloud outbox) with fixed ids, so nothing is lost or doubled.

Result

Off by default with no network code; the app stays fully offline. The connector is written once the backend API is shared.

Quality and evidence

Checks

- 799 automated tests pass, including 30+ new ones for the features above and the database upgrades (30 → 31 → 32).
- Code analysis: no errors or warnings.
- Merged to main through pull request #26 (merge commit aeb3c91).
- Continuous integration: all builds green (Windows passed on re-run after a one-off failure on GitHub's build machine; Android APK and tests passed).

Open items and support needed

Pending and risks

- Cloud connector: needs the Kigali backend's API document (endpoints, login method, data formats).
- Hands-on test on real devices (teacher PC and learner phone, internet off).
- “Tutor used” for written assignments; decision on an exam mode that switches the AI tutor off.
- Risk: every device in a class needs the new version, or timed assessments act as ordinary assignments.
- Risk: assessment times come from each learner's device clock.

Next priorities

Up next

- Real-device test of timed assessments.
- Teacher-to-learner support: send one learner targeted notes or a quiz and track whether they improve.
- Cloud connector once the API document arrives.
